- Questions & Answers

Introduction

- PHP (Personal Home Page Tools) is a computer scripting dynamically typed language mainly used for web applications development.

```
<?php
$num1 = 10;
$num2 = 20;
$num3 = 30;
$sum = $num1 + $num2 + $num3;
echo "sum=$sum";
?>
```

Introduction

- PHP was originally developed by Rasmus Lardorf in 1994, and was publicly released in June 1995. This released version is known as PHP 2.
- In 1997 Zeev Suraski & Andi Gutmans rewrote PHP parser and formed the base of PHP 3.
- In 1998 Zeev Suraski & Andi Gutmans started a new rewrite of PHP core and produced the Zend Engine in 1999.

Introduction

- On May 22nd 2000 PHP 4 powered by Zend Engine 1.0 was released.
- On July 13th 2004 PHP 5 powered by Zend Engine 2.0 was released.

Development Tools

- There are many different IDEs we can use in order to develop in PHP.

NetBeans

zendstudio

PhpStorm

Microsoft®
WebMatrix

Associative Arrays

- An array is an ordered collection of elements. Each element has a value, and is identified by a key. Each array has its own unique keys.

```
<?php
$vecA = array(100=>"moshe",101=>"david",102=>"john");
$vecB = array("m"=>"moshe","d"=>"david","j"=>"john");
$vecA[100] = "moshiko";
echo $vecA[101];
?>
```

Object Oriented Programming

- As of PHP 5, we can define classes, abstract classes and interfaces. The syntax is similar to the one we use in Java.

```
interface Printable
{
    function print();
}
```

```
class Bird extends Animal implements Printable, Flyable
{
    ...
}
```

Object Oriented Programming

- As of PHP 5.4, we can define traits in order to group functionality and share it horizontally with other classes.

```
trait Academic {  
    function think(){  
        echo "I think";  
    }  
}
```

```
class Student extends Person {  
    use Academic;  
    //...  
}
```

Functional Programming

- PHP allows us to assign functions to variables. We can easily define functions that take other functions as arguments.

```
<?php  
function doSomething() { ... }  
$temp = 'doSomething';  
$temp();  
?>
```

Functional Programming

- PHP allows us to define anonymous functions. Makes things simpler when passing over a function as argument to another function.

```
<?php  
doSomething(function() {...});  
?>
```

Web Applications Frameworks

- There are many available frameworks we can use when coding in PHP.

Certifications in PHP

- The professional certifications in PHP are managed by Zend and include the following two certifications:
Zend Certified Engineer in PHP 5.3
Zend Certified Engineer in Zend Framework
- You can find more information about these two certifications at <http://www.zend.com/services/certification/>
- You can find a complete list of all people world wide who were certified as PHP engineers at <http://www.zend.com/en/yellow-pages>.

Questions & Answers

- Two courses you might find interesting include

PHP Cross Platform Mobile Applications

[more info](#) [detailed plan](#)

Android 4.2 Applications Development
